

## How To Choose The Right Commercial Garage Doors For Your Business, Part 1

When choosing a garage door for your business, it's important to take the time to choose a door with durability and longevity.

If you make sure to choose the right door for your business needs, you will save money and time in the long run.

In this 3 part series, [CA Overhead Door](#) wants to help you learn how to choose the right commercial garage door no matter your company type.

### The Different Types Of Common Commercial Garage Doors

There are a variety of different types of commercial garage doors. To choose the right one for your needs, you need to be aware of the different types and what they have to offer.

#### **Overhead Door**

Overhead doors are a very common choice for commercial garage doors. Our garage door services can put these in with ease.

This type of garage door runs on a track from the ground until they are horizontal on the ceiling above. They can be either manual or motorized.

Overhead doors can be made out of multiple different materials such as wood, metal, aluminum, glass, or metal. You get to choose what type of material works best for you and looks best with your garage!

## **Scissor Doors**

Scissor doors are a unique type of commercial garage door to consider installing. You can use our garage door services to install this interesting and high-quality door.

Using a specific design, scissor gate doors move from side to side, like a sliding door rather than up and down.

One thing that sets this garage door apart is that they are constructed of high quality steel and offer a high level of protection.

## **Roll Up Doors**

This type of commercial garage door rolls up into a single coil, much like the name suggests.

The flexibility of this type of door is maximized by thin slats. This makes them more than ideal for places such as warehouses with limited space.

Roll up doors are often made of steel and are very sturdy.

## **Fire Rated Door**

When choosing what commercial garage door installation to go with you should consider fire rated doors.

[Frontier Pacific says,](#)

*“Fire-rated doors work similarly to roll up doors. They are raised and lowered using motorized equipment or manually. The main difference is they offer greater protection than most standard roll-up doors in the market.*

*This is because they are designed using thick, tough steel that provides insulation and resists noise and fire. Plus, they are flexible and can be custom-built for any door scenario. These doors are often used in parking garages, mills, warehouses, and distribution centers. They also come with auto closing functions in case of a fire.”*

These extra safety features can be a big benefit.
